

Question

A programmer has been asked to write a program which asks for 2 numbers, adds them together and displays the result.

Write an algorithm in pseudocode which will store two inputted numbers and output their sum.

Answer

Question

A programmer has been asked to write a program which asks for 2 numbers, adds them together and displays the result.

Write an algorithm in pseudocode which will store two inputted numbers and output their sum.

Answer

There are always different ways to solve a problem. This algorithm is just an example. What is important is that the logic is correct!

LOGIC:

- Ask the user for a number and store it in a variable
- Ask the user for another number and store it in a variable
- Add the contents of the two variables together
- Display the result

EXAMPLE ALGORITHM:

```
number1 = input("Enter first number")  
number2 = input("Enter second number")  
answer = number1 + number2  
print(answer)
```
