

Question

A programmer has been asked to write a program that prompts the user to enter their name and address, storing each in different variables. The program will then output their name and address back to the user for confirmation.

Write an algorithm in pseudocode which satisfies the above task.

Answer

Question

A programmer has been asked to write a program that prompts the user to enter their name and address, storing each in different variables. The program will then output their name and address back to the user for confirmation.

Write an algorithm in pseudocode which satisfies the above task.

Answer

There are always different ways to solve a problem. This algorithm is just an example. What is important is that the logic is correct!

LOGIC:

- Ask the user for their name
- Ask the user for their address
- Displays the data entered back to the user as a confirmation message

EXAMPLE ALGORITHM:

```
name = input("What is your name? ")  
address = input("What is your address? ")  
print("The data you entered was: ")  
print("Name: ", name)  
print("Address: ", address)
```
