

Question

A programmer has been asked to write a program which will generate a username by joining an inputted 'name' and 'year of birth'. If the username is not at least 10 characters in length, the program must repeatedly add the letter 'a' to the end of the username until it is at least 10 characters in length.

Write an algorithm in pseudocode which satisfies the requested program.

Answer

Question

A programmer has been asked to write a program which will generate a username by joining an inputted 'name' and 'year of birth'. If the username is not at least 10 characters in length, the program must repeatedly add the letter 'a' to the end of the username until it is at least 10 characters in length.

Write an algorithm in pseudocode which satisfies the requested program.

Answer

There are always different ways to solve a problem. This algorithm is just an example. What is important is that the logic is correct!

LOGIC:

- Ask the user for a name and store it in a variable
- Ask the user for a year and store it in a variable
- Join (concatenate) name and year and store in variable
- if the length of username is greater than 9 then display username however, if it is not...
- store the length of the username
- subtract this length from 10
- multiply an 'a' with the result and store the string
- display the username with the string joined at the end

EXAMPLE ALGORITHM:

```
name = input("Enter your name: ")  
yearOfBirth = input("Enter your year of birth")  
username = name + yearOfBirth  
if username.length > 9  
    print(username)  
else  
    length = username.length  
    numberNeeded = 10 - length  
    extraLetters = "a" * numberNeeded  
    print(username + extraLetters)  
endif
```
