

Question

A programmer has been asked to write a program which will receive a string from the user and output the number of times the letter 'e' appears in the string.

Write a program, in pseudocode, which contains the logic needed to solve the problem above.

Answer

Question

A programmer has been asked to write a program which will receive a string from the user and output the number of times the letter 'e' appears in the string.

Write a program, in pseudocode, which contains the logic needed to solve the problem above.

Answer

There are always different ways to solve a problem. This algorithm is just an example. What is important is that the logic is correct!

LOGIC:

- Ask the user to enter a string and store it in a variable
- Use a string manipulation method to count the instances of the letter 'e'
- Store the resulting number
- Output the number, along with a sensible message

EXAMPLE ALGORITHM:

```
string = input("Enter a word")  
numberOfEs = string.count("e")  
print("The letter 'e' appears in your string", numberOfEs, " times.")
```
